Dear Hiring Team,

I am applying for the Site Reliability Engineer position at ING Hubs Türkiye. Over the past almost five years I have worked on Linux-based platforms, from embedded Linux systems to networking products. The part of the job I enjoy most is keeping these systems running well once they are in real use: finding out why something misbehaves, fixing the cause rather than the symptom, and making sure it does not come back.

Much of my work has involved field issues, where I approached problems technically and systematically, working with colleagues, customers and external vendors until things were resolved. Along the way I automated repetitive work with Bash and Python and built tooling around releases, updates and log collection. I see reliability as a mix of good engineering and good operational habits, and this role looks like a place to grow in both.

I know the posting asks for slightly more years in a dedicated SRE role than I have, but I believe my hands-on experience with Linux systems, troubleshooting and automation gives me a solid base, and I learn quickly. I would be glad to talk about how I could contribute to your team.

Kind regards,
Hüseyin Felek
